

Truth in Coaching

*Licensed bandwidth frequencies
are unavailable or illegal for sports comm...*

Due to the recent DTV transition, many of the UHF frequencies formerly reserved for broadcasting have been **opened up as license-free**. Now sports comm systems can use these relatively open frequencies to stay far, far away from any "Wi-Fi," "Bluetooth," and other "2.4 GHz" interference, without any concern about interfering with broadcast stations.

*Unlicensed bandwidth technology is
superior and eliminates the need for
coordination.*

Using an unlicensed frequency eliminates the LEGAL need for coordination, but does not eliminate the need for understanding and minimizing the potential for interference from other devices. While some systems blindly and randomly occupy these crowded areas, our frequency-agile systems with ClearScan™ technology **intelligently find the best path**, considering the actual environment.

*Event coordination is
troublesome and unnecessary*

Even though unlicensed options can provide workable solutions, using licensed frequencies and event coordination remains the **best way to ensure clear game-time communications**. And there are now a variety of simple, inexpensive services and software packages to make it happen.

*The UHF system you have
isn't reliable, expandable,
or reconfigurable*

Actually, UHF systems are reliable, expandable, and reconfigurable. Contact Telex for more details.
